## PREFACE

In 1974, the provincial and federal governments in cooperation with the Federation of Associations on the Canadian Environment undertook a major inventory of municipal water and wastewater services in Canada. The results of that work were published as the "National Inventory of Municipal Waterworks and Wastewater Systems in Canada - 1975", and updated in 1978 and 1981. This publication represents the third update, and is identical in format to the 1981 version.

## PRÉFACE

En 1974, les gouvernements provinciaux et fédéral, en collaboration avec la Fédération des Associations canadiennes de l'Environnement (FACE), ont entrepris de dresser un inventaire de grande envergure des équipements en eau du Canada. Les résultats de ce travail ont été publiés dans "L'Inventaire national des équipements en eau des municipalités du Canada - 1975" et ont été mise à jour en 1978 et 1981. Nous vous présentons la troisième mise à jour dont la presentation est identique à celle de la version de 1981.

## INTRODUCTION

### 1.1 Purpose of Inventory Update

The 1986 version of the "National Inventory of Municipal Waterworks and Wastewater Systems in Canada" has been prepared for the purpose of maintaining a continuing and accurate account of municipal water and wastewater systems in Canada. The original inventory, first published in 1977, presented data for municipal services that existed up to the end of 1975; the first update of the original data included new and revised information on municipal systems up to the end of 1977. The publication was updated again in 1981. This report represents a third update and includes data from 1986.

### 1.2 Report Structure

Basic information on municipal waterworks and wastewater systems is provided in this publication. Readers requiring clarification on any of the material contained in the following pages or any additional information collected during the municipal surveys are requested to contact the federal, provincial or territorial agencies that participated in the data collection exercise (Appendix A). A copy of the survey questionnaire is available from these agencies upon request.

## INTRODUCTION

### 1.1 But de la mise à jour de l'inventaire

La présente édition a pour objet de présenter un inventaire suivi et fidèle des équipements municipaux en eau au Canada. Le premier inventaire, publié en 1977, contenait des données sur les services municipaux en place jusqu'à la fin de 1975; la première mise à jour s'était rendue jusqu'à la fin de 1977; et la publication fut de nouveau mise à jour, en 1981. Le présent rapport représente la troisième mise à jour et se fonde sur les données de 1986.

### 1.2 Plan du rapport

Les renseignements de base sur les équipements ont été inclus dans la présente publication. Les lecteurs qui désirent obtenir des éclaircissements sur les renseignements présentés ci-après ou des informations supplémentaires qui auraient été recueillies pendant les recensements municipaux sont priés de communiquer avec l'organisme provincial ou territorial qui a participé au rassemblement des données (Appendice A). On peut se procurer un exemplaire du questionnaire qui a servi à l'inventaire en s'adressant à l'un de ces organismes.

All information collected via the survey questionnaire is consolidated in a computer-based data management system called MUNDAT. The data base, though physically located in Ottawa, is accessible through time-sharing terminals across Canada. The system is capable of retrieving data in various formats and/or providing aggregate statistics on selected data elements. Interested readers are requested to contact the above-mentioned agencies or the following Environment Canada office for further information.

Tous les renseignements recueillis au moyen du questionnaire ont été réunis dans un système informatisé de gestion des données comme sous le nom de MUNDAT. Même si le fichier central se trouve à Ottawa, on peut y accéder à partir de terminaux à temps partagé situés d'un bout à l'autre du pays. Ce système peut extraire des données sous diverses formes et peut fournir des statistiques globales sur certains éléments. Les lecteurs qui désirent obtenir de plus amples renseignements sont priés de communiquer avec les organismes déjà mentionnés ou avec le bureau d'Environnement Canada, comme suit:

Inventory Management Division
Environmental Analysis Branch
Conservation and Protection
Environment Canada

Comments and suggestions regarding the content or format of this inventory are most welcome, and readers are encouraged to contact the Secretary of the Inventory Committee at the above address.

Les commentaires et suggestions concernant le contenu ou la présentation du présent inventaire sont les bienvenus, et on encourage les lecteurs à communiquer avec le Secrétaire du Comité de l'inventaire à l'adresse ci-dessus.

The latest version of the national inventory report presents a national overview of municipal water and wastewater systems, along with specific information on provincial and territorial water supply and wastewater disposal systems. In the national review, a select number of tables have been prepared to illustrate the elements of MUNDAT that are most frequently employed or requested by the public, government agencies, education institutions and industrial and commercial organizations. Provincial and territorial summary tables were compiled following the national review, and are organized in a format from east to west across Canada. Inventories of surveyed municipalities within each province have been arranged in alphabetical order for easy reference.

Two numerical coding systems are used to identify municipalities in the report. The first code is a seven-digit Standard Geographical Classification Code (SGC) developed by Statistics Canada and employed as the basic municipal identification tag. To supplement this code, two digits have been added to permit identification of smaller municipal entities within a larger municipality. These two digits are zeros in a situation where no smaller municipal units exist within a large municipality,

Cette dernière version de l'inventaire présente à l'échelle nationale une vue d'ensemble sur les équipements en eau des municipalités du Canada, ainsi que des renseignements précis sur les systèmes provinciaux et territoriaux en matière d'alimentation en eau et d'élimination des eaux usées. La partie qui porte sur l'ensemble du pays comprend un certain nombre de tableaux qui montrent les éléments du système MUNDAT qui sont le plus souvent utilisés ou demandés par le grand public, les organismes gouvernementaux, les institutions d'enseignement et les organismes industriels et commerciaux. Les tableaux compilés pour les provinces et territoires découlent de l'étude nationale et sont disposés de façon à couvrir le pays d'est en ouest. Dans chaque province, les municipalités sont traitées par ordre alphabétique, ce qui facilite la consultation.

Deux systèmes de codage numérique sont utilisés pour identifier les municipalités. Le premier est constitué de sept chiffres du code de classification géographique type (CGT) mis au point par Statistique Canada et servant de principal indicateur de municipalité. À ce code, on a ajouté deux autres chiffres afin de permettre l'identification de subdivisions des municipalités les plus vastes. Ces deux chiffres sont des zéros lorsqu'il

or where the classification code has not been adopted by the province.

The location of a municipality with reference to a water basin can be determined by a four-digit code provided in the 13th column of the municipal inventory listings. This code represents the first four characters of the station numbers used by the "Water Survey of Canada" (Inland Waters Directorate, Environment Canada) to identify monitoring stations. The Environment Canada publication entitled "Surface Water Data, Reference Index, Canada 1986", may be referred to for determination of the availability of hydrological data in specific water basins.

Users of Tables 2, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31 and 33 should be aware that inconsistencies may occur between the population data found in lines f) and j) and the population data found elsewhere in the table. This is because the population data comes from three sources in the MUNDAT data base. One source is based on population served by the various water treatment and wastewater treatment plants. The data in lines f) and j) fall into this category. Another source is based on municipal populations. The date in lines b) and d) are in this category. The third source was not updated for this publication. The

n'existe aucune subdivision ou lorsque le code de classification n'a pas été adopté par la province.

On peut situer la municipalité par rapport à un bassin hydrographique au moyen d'un code à quatre chiffres inscrit dans la 13e colonne des listes de l'inventaire municipal. Ce code représente les quatre premiers chiffres des numéros de station de contrôle de la Division des relevés hydrologiques du Canada (Direction générale des eaux intérieures). La publication d'Environnement Canada intitulée "Surface Water data, Reference Index, Canada 1986" peut être consultée pour déterminer s'il existe des données hydrologiques sur des bassins particuliers.

Avis aux utilisateurs des tableaux 2, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31 et 33: il se peut qu'il y ait certaines incohérences entre les données démographiques inscrites aux lignes f) et j) et celles figurant ailleurs dans le tableau. Cela est dû au fait que les données sur les populations viennent de trois sources différentes de la base de données MUNDAT. Une de ces sources est fondée sur les populations desservies par les diverses usines de traitement de l'eau et d'épuration des eaux usées. Les données des lignes f) et j) tombent dans cette catégorie. Une autre source se

data in line h) falls into this category and 1981 data was used here instead.

fonde sur les populations des municipalités. Les données aux lignes b) et d) tombent dans cette catégorie. La troisième source n'a pas été mise à jour pour la présente publication. Les données de la ligne h) tombent dans cette catégorie: nous avons utilisé les données de 1981 à la place.

## NATIONAL SUMMARY

The 1986 inventory of waterworks and wastewater systems includes 3 650 municipalities with a total surveyed population of 22 032 162. This represents about 88% of the population in Canada (1986 Census). Much of the remaining unsurveyed population lives in rural areas of the country and, for the most part, is serviced by private wells and private waste treatment and disposal systems such as septic tanks and tile fields.

Table 1 gives preliminary results from Statistics Canada on provincial and territorial populations in Canada, based on the 1986 Census.

Table 2 is the national summary of the extent of municipal water and wastewater services. The water supply data in this table indicate that of the total surveyed population, about 3 million people are on private water systems or on distribution systems being served by raw water. Review of the population size groups indicates that municipalities with populations of 30 000 or less (i.e., rural municipalities) account for the majority of these situations.

## SOMMAIRE POUR L'ENSEMBLE DU PAYS

L'inventaire de 1986 porte sur 3 650 municipalités, d'une population recensée de 22 032 162 habitants. Cela représente environ 88% de la population du Canada (Recensement de 1986). Une grande partie de la population non recensée habite des zones rurales du pays et est majoritairement desservie par des puits privés et par des systèmes privés de traitement et d'élimination des eaux usées tels que des fosses septiques et des champs d'épuration.

Le tableau 1 donne les résultats préliminaires obtenus par Statistique Canada, lors du Recensement de 1986, relativement aux populations des provinces et des territoires.

Le tableau 2 résume, pour tout le pays, l'étendue des services d'alimentation en eau et de traitement des eaux usées. Pour l'alimentation, quelque 3 millions de personnes de la population recensée sont desservies par des réseaux d'aqueduc privés ou par des aqueducs les alimentant en eau brute. La plupart du temps, elles habitent les municipalités d'au plus 30 000 habitants (c.-à-d. des municipalités rurales).

The population served by sewers has not been updated, 1981 data has been used instead as indicated in the Introduction. Therefore, no conclusions can be drawn as to the number of people discharging raw sewage to collection systems that are not connected to sewage treatment facilities.

Table 3 is a summary of provincial and territorial information on municipal water use by residential, commercial, industrial and institutional consumers. This table has not been updated, 1981 data has been used instead. The percentages cited represent a best estimate for each of the specified categories; national percentages have been calculated by flow proportioning the user categories for each province and territory. Column 5, entitled "Other", refers to discrepancies between water discharge measurements at the water treatment plant and meter readings or approximations of water use at the user end of the distribution system. These discrepancies are interpreted as being system leakages, errors in estimation of water use, and/or the result of unmetered water use. It is evident that most industrial users supply their own water and therefore the figures presented in Table 3 represent

Les données sur les populations desservies par les égouts n'ont pas été mises à jour; à leur place, nous avons utilisé les données de 1981, tel que nous l'avons mentionné dans l'introduction. En conséquence, on ne peut tirer de conclusions sur le nombre de personnes déversant des effluents bruts dans les réseaux collecteurs non reliés aux installations d'épuration des eaux usées.

Le tableau 3 est un sommaire des renseignements provinciaux et territoriaux sur l'utilisation d'eau municipale par les consommateurs résidentiels, commerciaux, industriels et institutionnels. Le présent tableau n'a pas été mis à jour; nous avons utilisé les données de 1981 au lieu des données actuelles. Les pourcentages cités représentent la meilleure estimation pour chacune des catégories indiquées, tandis que les pourcentages nationaux ont été calculés proportionnellement au débit, selon la catégorie d'utilisateurs dans chaque province et territoire. La cinquième colonne, intitulée "Autres", se rapporte aux écarts entre la mesure du débit d'alimentation provenant des usines municipales et les lectures faites aux compteurs ou les estimations de l'eau consommée. Ces écarts sont interprétés comme étant des fuites dans le réseau,

only a small portion of the total water consumption by industry.

The frequency with which various treatment processes are applied at water treatment plants throughout Canada is provided in Table 4. Column one of Table 4 gives some indication of the number of instances where pretreatment of drinking water is not applied. In rural municipalities, water distribution systems are often supplied or supplemented by groundwater sources, and in many cases the quality of groundwater may be such that no pretreatment is required. Although it is possible that some surface waters are drinkable in their raw state, it is likely that disinfection would be required as a minimum level of treatment in such instances. As might be anticipated the most common unit process in use at water plants is disinfection, with chlorine gas being the most frequently employed disinfecting agent. It is interesting to note that ozone is employed for disinfection purposes at 24 water treatment plants, 19 of which are located in the province of Quebec.

des erreurs d'estimation ou encore le résultat d'une consommation non mesurée au compteur. Dans le cas des utilisateurs industriels, il est évident que la plupart des usines fournissent leur propre eau; les chiffres indiqués au tableau 3 ne représentent donc qu'une petite partie de la consommation totale en eau attribuable à l'industrie.

Le tableau 4 donne la fréquence d'application des divers procédés de traitement aux usines d'épuration au Canada. La première colonne y donne une certaine indication du nombre de cas où le prétraitement d'eau potable n'est pas effectué. Dans les municipalités rurales, les réseaux d'aqueducs sont souvent alimentés, en totalité ou en partie, à partir de sources souterraines; dans bien des cas, la qualité de cette eau est telle qu'il n'est pas nécessaire de la soumettre à un prétraitement. Même s'il est possible que certaines eaux de surface sont potables à l'état brut, il est probable qu'on ait à les désinfecter à titre de précaution minimale. Comme prévu, le procédé le plus répandu est la désinfection, le chlore gazeux étant l'agent le plus souvent employé. Il est intéressant de noter que l'ozone sert à la désinfection dans 24 usines d'éputation, dont 19 sont situées au Québec.

Table 5 lists the total number of water treatment plants included in the national survey on a province-by-province basis and specifies the responsible operating authorities for these plants. This table has not been updated, 1981 data has been used instead. The lack of uniformity in the definition of a "water treatment plant" during the municipal survey has lead to distortions of the figures in the "Total" column. Over 50% of the plants listed in the table are found in Quebec. In fact, as explained in the discussion of Table 4, many of the plants may be wells and/or pumping stations which were included as water treatment plants in the survey.

Table 6 is the first in a series of summary tables which examine wastewater servicing in Canada. This table has not been updated, 1981 data has been used instead. The percentages cited in Table 6 represent best estimates of average daily wastewater flow received from residential, commercial, industrial and institutional users of municipal sewage collection systems. The national average has been calculated by flow proportioning the discharges from each category for each of the provinces and territories. Column 6, entitled "Other",

Le tableau 5 donne le total des usines d'épuration comprises dans le recensement national, par province, et indique quels sont les organismes responsables de l'exploitation de chacune de ces usines. Le présent tableau n'a pas été mis à jour; nous avons utilisé les données de 1981 au lieu des données actuelles. Le manque d'uniformité de la définition de l'expression "usine d'épuration" pendant le recensement municipal a produit des distorsions dans le nombre total d'usines. Plus de la moitié des usines énumérées se trouvent au Québec et, comme c'est expliqué dans la discussion du tableau 4, beaucoup de ces usines pourraient tout simplement être des puits ou des stations de pompage.

Le tableau 6 est le premier d'une série qui porte sur les services de traitement au Canada. Le présent tableau n'a pas été mis à jour; nous avons utilisé les données de 1981 au lieu des données actuelles. Les pourcentages indiqués représentent la meilleure estimation du débit moyen quotidien d'eaux usées rejetées dans les égouts municipaux par les utilisateurs résidentiels, commerciaux, industriels et institutionnels. La moyenne nationale a été calculée en proportion du débit des

refers to unaccounted wastewater flows into municipal sewage treatment plants.

Table 7 presents a summary compilation of provincial and territorial populations served by sewers. This table has not been updated, 1981 data has been used instead. Two types of sewer systems are employed, i.e., combined and separate. Combined sewers are defined as sewers that carry both storm and sanitary wastewaters. Separate sewers carry storm and sanitary wastes in separate collectors. Overall, the data indicate that public sewage collection systems serve 17.9 million Canadians; 65% of these people reside in municipalities that are totally or in part serviced by separate collectors. Figures on populations served by sewage treatment plants indicate that wastewater from 35% of these 17.9 million Canadians is not being treated.

In Table 8, four types of treatment systems are listed, specifically, primary, secondary, lagoons, and septic tanks. The distinction between types of treatment has been based principally on the

rejets de chaque catégorie pour chacune des provinces et chacun des territoires. La sixième colonne, intitulée "Autres", rapporte aux débits non calculés qui parviennent aux usines d'épuration municipales.

Le tableau 7 présente une compilation sommaire des populations provinciales et territoriales desservies par des réseaux d'égouts, unitaires et séparatifs. Le présent tableau n'a pas été mis à jour; nous avons utilisé les données de 1981 au lieu des données actuelles. Les réseaux unitaires acheminent à la fois les eaux pluviales et les eaux usées, les séparatifs acheminent les eaux pluviales et usées dans des canalisations distinctes. Dans l'ensemble, les données montrent que 17,9 millions de Canadiens sont desservis par des systèmes d'égouts publics; 65% de ces gens habitent des municipalités desservies entièrement ou en partie par des réseaux séparatifs. D'après les statistiques sur les populations desservies par des usines d'épuration, les eaux usées de 35% de ces 17,9 millions de Canadiens ne subissent aucun traitement.

Au tableau 8, on énumère quatre systèmes de traitement: le traitement primaire, le traitement secondaire, le lagunage et les fosses septiques. La distinction entre ces systèmes se fonde

physical components which make up the actual treatment systems, i.e., primary systems include systems that depend on primary clarifiers as the sole component for removing suspended or colloidal material from wastewaters; secondary systems include mechanical plants having aerobic biological treatment processes and secondary clarifiers. Where a primary system is in series with a lagoon, the system has been referred to as a lagoon system; the quality of effluent has been assumed to be similar to a lagoon effluent. When lagoon cells preceded or followed a secondary system, the system was categorized as a secondary system. Other types of treatment systems are not specified (e.g., comminution only) but have been included in the Table 8 plant count.

Table 9 lists the number of wastewater treatment plants included in the national survey on a province-by-province basis and specifies the responsible operating authorities for these plants. This table has not been updated, 1981 data has been used instead.

Table 10 provides a detailed look at the various treatment processes that are in use at municipal sewage treatment plants. The levels of treatment examined are primary, secondary and lagoon; the

principalement sur la nature des dispositifs qui les composent: les systèmes primaires comprennent ceux qui éliminent les matières en suspension ou colloidales au moyen de décanteurs primaires seulement; les systèmes secondaires comprennent toutes les usines de traitement mécanique utilisant des processus aérobies de traitement biologique et des décanteurs secondaires. Lorsqu'un système primaire est employé "en série" avec un étang, on parle de language, la qualité de l'effluent étant supposée semblable à celle de l'effluent du lagunage. Lorsque les étangs précèdent ou suivent le traitement secondaire, le système est qualifié de secondaire. Les autres genres de traitement n'ont pas été catégorisés (ex. dilacération seulement), mais ils sont compris dans le total des usines, au tableau 7.

Le tableau 9 énumère les usines d'épuration qui ont été recensées à l'échelle nationale, par province, et indique quels en sont les organismes responsables. Le présent tableau n'a pas été mis à jour; nous avons utilisé les données de 1981 au lieu des données actuelles.

Le tableau 10 donne un aperçu détaillé des divers procédés de traitement qui sont utilisés dans les usines d'épuration municipales. Les niveaux de traitement sont les suivants:

definition of each term is the same as for Table 8. The unit processes listed have been broadly categorized into physical, biological, tertiary and disinfection processes. Double counting occurs throughout Table 10 due to the nature of the table and organization of treatment systems. For example several physical processes (e.g., screening, comminution and grit removal) may be incorporated into one treatment system and that system is counted each time a unit process is identified in the table.

traitement primaire; traitement secondaire et language; leur définition est la même qu'au tableau 8. Les procédés énumérés ont été classés de façon générale en procédés physiques, biologiques, tertiaires et de désinfection. Un comptage double occupe tout le tableau 10 à cause de la nature de ce tableau et à cause de la classification des systèmes de traitement. Par exemple, plusieurs procédés physiques (ex. filtrage, dilacération et dessablement) peuvent être incorporés dans un système de traitement, et ce système est compté chaque fois que le tableau identifie un procédé distinct.

* For water supply plants in Québec many small rural systems operating from wells have been classified as plants. Raw water quality at these locations is such that no form of treatment is required.

* Au Québec, beaucoup de petites installations rurales branchées sur des puits sont classées comme usines. La qualité de l'eau rend inutile son traitement.

## APPENDIX B

## LIST OF ABBREVIATIONS/LISTE DES ABRÉVIATIONS

## LIST OF ABBREVIATIONS/LISTE DES ABRÉVIATIONS

### 1. GENERAL ABBREVIATIONS/ABRÉVIATIONS GÉNÉRALES

| | |
|---|---|
| DESS | DESSERVI(E) |
| N | NO/NON |
| POP | POPULATION |
| Y/O | YES/OUI |

### 2. WATER SUPPLY SYSTEMS/SYSTÈMES D'APPROVISIONNEMENT EN EAU

| | |
|---|---|
| AER/AÉR | AERATION/AÉRATION |
| C ABS | CARBON ABSORPTION/ABSORPTION AU CARBONE |
| Cl CMP | DISINFECTED WITH CHLORINE COMPOUNDS/DÉSINFECTION AUX COMPOSÉS DE CHLORE |
| Cl GAS/GAZEUX | DISINFECTED WITH CHLORINE GAS/DÉSINFECTION AU CHLORE GAZEUX |
| COAG | COAGULATION/COAGULATION |
| FE/MN | IRON AND/OR MANGENESE REMOVAL/ÉLIMINATION DU FER ET/OU DU MANGANESE |
| FILT | FILTRATION/FILTRATION |
| FI | FLUORIDATION/FLUORISATION |
| GRO/TER | GROUND/TERRE |
| OZONE | DISINFECTED WITH OZONE/DÉSINFECTION PAR OZONE |
| pH ADJ/RÉG pH | pH ADJUSTMENT/RÉGLAGE DU pH |
| PUR/ACH | PURCHASED/ACHETÉ(E) |
| S/A | SOFTENING/ADOUCISSEMENT |
| SED | SEDIMENTATION/SEDIMENTATION |
| SHA/PAR | SHARED/PARTAGÉ(E) |

| | |
|---|---|
| T/O | TASTE AND ODOUR CONTROLS/<br>ÉLIMINATION DU GOÛT ET DE L'ODEUR |

## 3. WASTEWATER SYSTEMS/SYSTÈMES D'ÉPURATION DES EAUX USÉES

| | |
|---|---|
| AER/AÉR | AERATED/AÉRÉ(E) |
| AER DIG/DIG AÉR | AEROBIC DIGESTION/DIGESTION AÉROBIE |
| ANAER | ANAEROBIC/ANAÉROBIE |
| AS/BA | CONVENTIONAL ACTIVATED SLUDGE/<br>BOUES ACTIVÉES ORDINAIRES |
| BAR SCR/GB | BAR SCREEN/GRILLE À BARREAUX |
| COM/DIL | COMMINUTION/DILACÉRATION |
| COMB | COMBINED/UNITAIRES |
| CS/SC | CONTACT STABILIZATION/<br>STABILISATION PAR CONTACT |
| EA/AP | EXTENDED AERATION/AÉRATION<br>PROLONGÉE |
| EQUAL/RÉG | EQUALIZATION FACILITIES/<br>INSTALLATIONS DE RÉGULARISATION |
| FAC | FACULTATIVE//FACULTATIF(VE) |
| GRT REM/DES | GRIT REMOVAL/DESSABLAGE |
| HRAS/BAHC | HIGH RATE ACTIVATED SLUDGE/BOUES<br>ACTIVÉES À HAUTE CHARGE |
| OD/FO | OXIDATION DITCH/FOSSÉ D'OXYDATION |
| P CLAR/DÉCAN P | PRINARY CLARIFICATION/<br>DÉCANTATION PRIMAIRE |
| PROC/TRAIT | PROCESSING/TRAITEMENT |
| RBC/DB | ROTATING BIOLOGICAL CONTACTOR/<br>DISQUES BIOLOGIQUES |
| SAN | SANITARY/USÉES |
| SEP | SEPARATE/SÉPARATIFS |

| | |
|---|---|
| SL CENT/CENT B | SLUDGE CENTRIFUGE/CENTRIFUGEUR DE BOUES |
| SL DR BD//LITS SEC B | SLUDGE DRYING BEDS/LITS DE SÉCHAGE DES BOUES |
| SL FILT/FILT B | SLUDGE FILTRATION/FILTRATION DES BOUES |
| SL LAG/ÉTANG B | SLUDGE LAGOON/ÉTANG À BOUES |
| SL THICK/ÉPAIS B | SLUDGE THICKENERS/ÉPAISSISSEUR DE BOUES |
| SS AN DIG/DIG ANAÉR SE | SINGLE-STAGE ANAEROBIC DIGESTION/ DIGESTION ANAÉROBIE EN UNE SEULE ÉTAPE |
| ST/FS | COMMUNAL SEPTIC TANK/FOSSÉ SEPTIQUE PUBLIQUE |
| TF/L B | TRICKLING FILTER/LIT BACTÉRIEN |
| TS AN DIG/DIG ANAÉR DE | TWO-STAGE ANAEROBIC DIGESTION/ DIGESTION ANAÉROBIE EN DEUX ÉTAPES |
